

Group Project Idea

Reddit like app (forum)

Video in the background of the model (modle used for the log in)

**Welcome page:** company name, huge welcome sign

**about the project page:** a reddit type safe-space forum like website for rage-quitting gamers.

**specifications page:**

the purpose: give individuals a place to vent about different games, creating and finding threads.

list of Deliverables: a website, a login modle (with video background), upvote and downvote

use case: developer (change code and everything), guest (only view), admin (they can control which threads to delete, for now the developers), user (post, read, comment but can't delete other thread, only their post)

database design: username, password, email, account type (only user account is available at first)- —— continue as guest button (guest account is on the website by default, this is the one we use)

Login, post(images and text, and maybe gifs late), read, delete own posts, respond/comment

Only show 20 thumbnails based of titles of the diff threads, once clicked on, go to new page with the full thread. Back page needed. Main page has sort by new and most viewed. Click on arrows to get to different pages. Adding a thread, submit button creates a new page, adds it to the thread database, which then updates the main page, and puts it at the top (if sorted by new),

**project plan:**

schdule: follow the schedule

features if time: add communities if time permits, threads inside of threads, emoji reacts and a gif keyboard, most upvotes and most viewed posts and new. Also search function.

features if no time: end up with just one account type (not being able to implement 4 different types of accounts), upvote and downvotes

**team page:**

put ur shit here
